Experience

Backend Developer *AiCon Solutions* - Jan 2026 – Present

- Designed and developed secure financial systems using Laravel, including digital wallets, multi-level user hierarchies, subscriptions, transfers, commissions, settlements and transaction reporting.
- Architected and delivered a complete B2B API platform for external clients, with webhooks, idempotency, standardized error handling and full partner integration documentation.
- Integrated the platform with Syriatel, MTN and Paymera through a unified integration layer with automatic reconciliation of pending transactions.
- Scaled the platform for production using Laravel Octane, Redis/Horizon queues, PgBouncer and a PostgreSQL read replica.

Backend Developer *Teknova Company* - Jul 2025 – Dec 2025

- Developed and maintained RESTful APIs and Laravel Backpack administrative dashboards, focusing on clean code, maintainability, and reliable backend functionality.
- Contributed to the design and deployment of a Docker-based microservices architecture, integrating a MySQL, Redis, and RabbitMQ for asynchronous messaging.
- Tested APIs across various scenarios to ensure reliability and performance.
- Worked with monitoring and observability tools, including Prometheus and Grafana, to track system health and enhance performance visibility.

Education

Bachelor of Information Technology Engineering 2022 – 2027

Damascus University

Skills and Tools

- **Backend Development:** PHP, Laravel, RESTful APIs, Clean Architecture, WebSockets, API Authentication (JWT, Sanctum)
- **Financial Systems:** Digital Wallets, Payment Processing, Payment Provider Integrations, Webhooks, Idempotency, Concurrency Control, Reconciliation
- **Database and Caching:** MySQL, PostgreSQL, Redis, PgBouncer
- **Queues & Performance:** Redis Queues, Laravel Horizon, RabbitMQ, Laravel Octane (Swoole)
- **DevOps:** Docker, Linux, Nginx, GitLab CI/CD, Git, GitHub
- **Problem Solving:** Algorithmic Problem Solving, Competitive Programming , Data Structures and Algorithms
- **Soft Skills:** Research, Communication, Teamwork

Projects

Abili Fawran – Digital Wallet & Payment Platform (3abilly-sy.com) AiCon Solutions

Tech Stack: PHP 8.3, Laravel 12, PostgreSQL, Redis, Horizon, Octane (Swoole), PgBouncer, Docker, GitLab

- Built the platform’s core modules: digital wallets, multi-level user hierarchies, subscriptions, transfers, commissions, settlements, service payments and funding, with full transaction management and reporting.

- Engineered transaction processing with arbitrary-precision arithmetic, atomic conditional balance updates, row-level locking and idempotency keys. This prevents double-spending and duplicate charges under concurrent load.
- Architected a complete external API with token-based client authentication and scoped abilities, payment execution, transaction status inquiry, and balance inquiry.
- Implemented HMAC-signed webhooks in both directions (delivery to clients and consumption from providers), strict request validation, idempotent requests, and a unified error contract with standardized error codes.
- Provided end-to-end transaction traceability through correlation IDs, and wrote full integration documentation (an integration guide and an OpenAPI specification) for partners.
- Integrated Syriatel, MTN, Paymera, MegaNet and EasyPay behind a unified Strategy/Adapter layer, with real and mock clients for each provider.
- Handled timeouts and unknown-state transactions with automatic status re-checks and scheduled reconciliation of stuck transactions.
- Scaled the platform with Laravel Octane (Swoole), Redis/Horizon queues, PgBouncer connection pooling, a PostgreSQL read replica and OPcache.
- Enforced test isolation with pinned mock providers and a dedicated test database, so no test run can reach live payment providers.
- Migrated a legacy production platform to a modern layered architecture (Services, DTOs, Enums, FormRequests, API Resources) with zero-downtime database migration practices, resolving long-standing data and design issues.

Tfadal – Ride-Hailing Platform (tfadal.sy) AiCon Solutions

- Contributed to the ongoing development and maintenance of a production ride-hailing platform.
- Redesigned the ride dispatching workflow by refactoring queue processing, improving scalability and reducing database load.
- Optimized the push notification system by implementing Firebase Cloud Messaging (FCM) Topics for more efficient and scalable message delivery.
- Enhanced the mapping infrastructure by deploying and customizing an OSRM server, including developing automation scripts to refine map regions and location data.
- Developed driver performance analytics, including response rate and ride acceptance metrics.
- Refactored code and resolved issues to improve system stability and performance.

ZAD – Real Estate Management System *Teknova Company*

Tech Stack: Laravel, MySQL, Redis, RabbitMQ, Laravel Reverb, Docker, Traefik, Nginx

- Engineered core backend services within a Dockerized microservices architecture routed via Traefik API Gateway, supporting property listings, live auctions, commercial offers, subscription plans, and building-materials workflows.
- Implemented asynchronous inter-service communication and event-driven background processing using RabbitMQ, alongside Redis for high-speed data caching.
- Built real-time bidirectional chat functionality using Laravel Reverb (WebSockets) to enable instant communication between buyers, sellers, and platform agents.

Achievements

- Tester: Participated as a tester for the Latakia University Official Programming Contest.
- Contestant: Participated as a contestant in the Damascus University Official Programming Contest (7th place – Bronze medal).
